Horton Automatics releases an interactive Revolving Door Energy Savings, CO2 Savings and Payback Calculator

Corpus Christi, TX, Sept 14, 2009 –

Revolving Doors save energy. Revolving Doors save money. Determine how much a revolving door installed in your building can save and how quickly it will pay for itself.

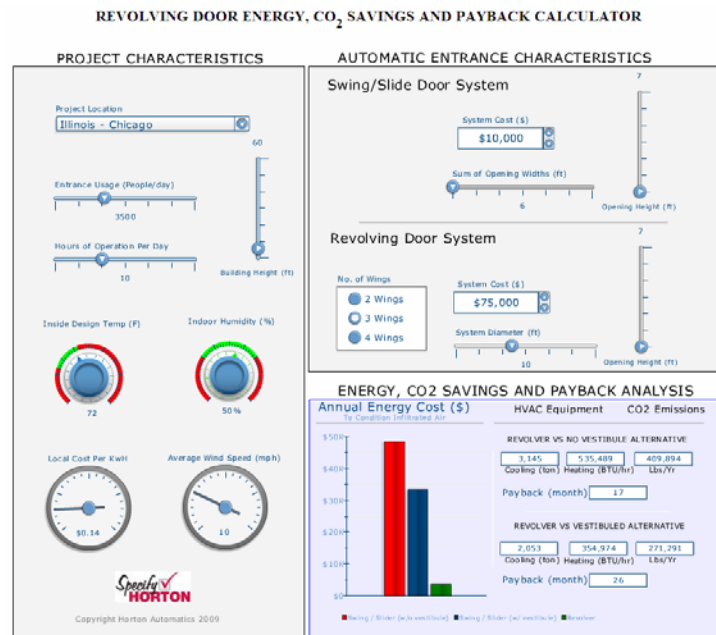

Horton Automatics offers an easy to use online calculator that allows architects, building owners and our customers to enter variables specific to the building, city, utility costs and entrance usage and see the savings and payback period. For your convenience, Horton Automatics can also do the calculations and send the results to you by email. Simply fill out the online form and submit.

For over 100 years, revolving doors have been reducing drafts and creating comfort inside of building lobbies and are widely used throughout the world. In today's economy, and with concerns for energy conservation, revolving doors are more popular than ever.

The Energy, CO2 Savings and Payback Calculator Calculation utilizes an advanced, interactive dashboard to show immediate results as data, specific to the project, is entered. The calculator uses climatology data, utility cost data, entrance usage data and budgeted door costs in its calculations.

Studies have been conducted by prestigious institutions, including the Massachusetts Institute of Technology (MIT), and the benefits of using a revolving door are clear. See how a revolving door can make a significant impact for your building and for the environment.

To use the calculator please contact Carlos Cantu at 800-531-3111, ext.155 or go to hortondoors.com and fill out the worksheet and submit.

Horton Automatics is leading manufacturer of automatic entrance systems, including sliding, swing and revolving doors as well as platform screen doors, industrial doors and service windows. Horton is headquartered in Corpus Christi, Texas and operates facilities in Mexico and the UK. Horton Automatics is a division of Overhead Door, A Sanwa Shutter Company.
